Terminology. Although the term insulator implies low electrical conduction, dielectric typically means materials with a high polarizability. The latter is expressed by a number called the relative permittivity. The term insulator is generally used to indicate electrical obstruction while the term dielectric is used to indicate the energy storing capacity of the material (by means of polarization).

Electrical breakdown or dielectric breakdown is when current flows through an electrical insulator when the voltage applied across it exceeds the breakdown voltage. This results in the insulator becoming electrically conductive. Electrical breakdown may be a momentary event (as in an electrostatic discharge), or may lead to a continuous arc if protective devices fail to interrupt the current in ...

Electrical conductivity is ability of material to conduct electric current.. The electrical conductivities differ by a factor as large as  $10^{12}$  to  $10^{21}$  between metallic and ceramic materials.. Most of ceramic materials are dielectric (materials, having very low electric conductivity, but supporting electrostatic field).. Electrical conductivity of ceramics varies with the frequency of field ...
