Evolution is change in the heritable characteristics of biological populations over successive generations. These characteristics are the expressions of genes that are passed on from parent to offspring during reproduction. Different characteristics tend to exist within any given population as a result of mutation, genetic recombination and other sources of genetic variation.

Neo-Darwinism can rebut this line of criticism in two ways: 1) almost any gene will work as a "many-worlds" theory of biology, or; 2) there is an easily-found mutational pathway, as Manfred Eigen described in 1987, leading from the first set of primitive genes to all of the genes subsequently used in biology. But, since 1987, Eigen's model has not been fleshed out.
