

exponential growth and decay pdf

Exponential growth is exhibited when the rate of change—the change per instant or unit of time—of the value of a mathematical function is proportional to the function's current value, resulting in its value at any time being an exponential function of time, i.e., a function in which the time value is the exponent.

Exponential decay occurs in the same way when the growth rate is negative.

Measuring rates of decay Mean lifetime. If the decaying quantity, $N(t)$, is the number of discrete elements in a certain set, it is possible to compute the average length of time that an element remains in the set. This is called the mean lifetime (or simply the lifetime), where the exponential time constant, τ , relates to the decay rate, λ , in the following way:
